Bridge Day 15 STUDENT QUIZ

Strings as Sequences, Collection, and Slicing

Learning sequence: Predict - Trace - Explain - Test - Interpret

Friday, July 24, 2026 • 20 points • target 20 minutes

Name		UIN		Section	

Assessment boundary and evidence source

Contract: 07a04826c975
Cumulative foundations: indexes, string traversal, append, membership, slicing, concatenation
Scaffold level: complete string/list sequence program
Evidence source: the matching v5 workbook readiness/evidence pages and VIP activities 18.23, 18.24.
Show intermediate state for trace credit. Program credit requires one coherent solution, a stated assumption when the prompt leaves one implicit, and at least one test whose expected result can distinguish correct from incorrect logic.

Item 1. Trace sequence state and direct slicing. - 4 points

```
text = "bridge"
pieces = []

for index in range(0, len(text), 2):
    pieces.append(text[index])

middle = text[1:5]
result = pieces + [middle]
print(pieces)
print(middle)
print(result)
```

Question: Give the index ledger, slice boundaries, and every exact output line.

Item 2. Repair list/string concatenation. - 3 points

```
items = ["x"]
items = items + "y"
print(items)
```

Question: Name the error and give both a concatenation repair and an append repair.

Complete program - 13 points

- Read word as text and print invalid if its length is less than 3.
- Otherwise append characters at odd indexes to odd_characters.
- Count lowercase t characters.
- Build frame from the first one-character slice plus the last one-character slice.
- Print Odd, Lowercase t, and Frame on separate labeled lines. Include an iteration test with expected output.

Program workspace

Test input, expected result, and why this test matters

Quiz evidence is sampled from the taught construct boundary; workbook and notebook evidence remain the primary learning surfaces.
