Bridge Day 8 STUDENT QUIZ

Debugging, Boundary Tests, and Complete Repair Evidence

Wednesday, July 15, 2026 • 20 points • target 17 minutes

Name		UIN		Section	

Assessment boundary and evidence source

Contract: 07a04826c975
Cumulative foundations: input conversion, comparisons, Boolean repair, expected vs actual, boundary tests
Scaffold level: complete program plus protective test set
Evidence source: the matching v5 workbook readiness/evidence pages and VIP activities 18.13, 18.14, 18.15, 18.16, 18.17.
Show intermediate state for trace credit. Program credit requires one coherent solution, a stated assumption when the prompt leaves one implicit, and at least one test whose expected result can distinguish correct from incorrect logic.

Item 1. Diagnose an inclusive-boundary defect. - 5 points

```
temperature = 35
ready = temperature > 15 and temperature < 35
print(ready)
```

Question: The requirement includes 15 and 35. Give actual result, cause, corrected assignment, and two tests that expose the defect.

Item 2. Build a minimum protective boundary set. - 5 points

```
reading = 10
low = 10
high = 20

if reading < low:
    status = "below"
elif reading > high:
    status = "above"
else:
    status = "within"

print(status)
```

Question: Give exact supplied output, then specify four tests that protect both inclusive boundaries and their immediate outside cases.

Complete program - 10 points

- Read reading, low, and high as floats.
- Print invalid when low is greater than high.
- Otherwise print Result: below, Result: within, or Result: above. Equality at either limit is within.
- Use one mutually exclusive chain and provide four boundary tests with expected output.

Program workspace

Test input, expected result, and why this test matters

Quiz evidence is sampled from the taught construct boundary; workbook and notebook evidence remain the primary learning surfaces.
