

ENGR 102 Summer Bridge

Day 13 Student Workbook

Loop Design, Break, Continue, and Nested Tracing

Wednesday, July 22, 2026 • 50 points

Name		UIN		Section	
------	--	-----	--	---------	--

Boolean-operator convention. Python operators appear as **and**, **or**, and **not**. Their lowercase spelling is required in code.

Daily target

increasing independence

Select skip, stop, and reset behavior while tracing repeated work inside repeated work.

Allowed tools	Prior tools plus break, continue, and nested for-loop tracing
Support supplied	Behavioral requirements and a sample input stream are supplied.
You must decide	Loop form, placement of skip and stop decisions, state updates, and reset scope.
Scaffold level	Requirements only; students select the control-flow pattern.

Scoring and completion standard

50 points

Evidence	Points	Secure work shows
Integrated trace	10	intermediate state, condition results, and exact output
Diagnosis and repair	8	actual, intended, cause, repair, and a boundary test when requested
Full program and tests	32	coherent executable logic, required output, and defended tests

Independence standard. You may use the supplied requirements and examples, but you must produce one connected solution. A collection of disconnected correct lines is not yet a complete program.

Begin with the trace, then use its evidence habits when you construct.

Task 1. Integrated trace**10 points**

Trace nested repetition while distinguishing a skipped pass, an early stop, and a per-station reset.

```
overall = 0

for station in range(1, 3):
    station_total = 0
    for reading in [0, station + 1, 5]:
        if reading == 0:
            continue
        if reading == 5:
            break
        station_total = station_total + reading
    overall = overall + station_total
    print(station, station_total)

print(overall)
```

Your task

1. Give a complete reached-pass ledger that identifies the continue, break, station_total reset, and overall update.
2. Write every output line and explain why the inner break does not end the outer loop.

Task 2. Diagnose and repair**8 points**

The intent is to print every odd integer through 5 and then stop. The current order omits 5.

```
value = 0
while value < 8:
    value = value + 1
    if value % 2 == 0:
        continue
    if value == 5:
        break
    print(value)
```

Your task

1. Give actual versus intended output, identify the ordering cause, and write a minimal repair that still stops at 5.

Debugging evidence is complete only when the repair is tied to the stated defect and an expected result.

Task 3. Construct a complete program**32 points across Pages 4-5****Program specification**

- Repeatedly read an integer inspection code.
- Code 0 ends normal input. A negative code is ignored and processing continues.
- A code of 90 or greater is a shutdown code: stop immediately without counting or adding it.
- Each positive code below 90 is accepted. Count accepted codes and add their values.
- After the loop, print `accepted_count` and `total` on separate lines.

Program workspace – begin the connected solution here.

Task 3 continued. Test and defend the program**included in 32 points**

Continue code if needed.

Required tests, expected results, and brief defense

VIP Lab Alignment

Bridge Day 13 • Contract 7cc3f8d502f3

This page adds a current lab handoff while preserving the workbook's independence-ramp tasks.

Why this page is here

VIP Lab Day(s): 5

Activities: 18.18, 18.19, 18.20, 18.21, 18.22

Select a loop form from the requirement, then complete an entire sample/transfer pair without an ordered algorithm being supplied.

Open these current notebook cells

Activity / stable cells	Notebook work	Evidence to carry forward
18.18 18-18-work / 18-18-transfer / 18-18-cold	Multiples In Range	Choose inclusive range bounds.
18.19 18-19-work / 18-19-transfer / 18-19-cold	Countdown To Multiple	Write a while condition from a divisibility goal.
18.20 18-20-work / 18-20-transfer / 18-20-cold	Smallest Value	Initialize comparison state from real data.
18.21 18-21-work / 18-21-transfer / 18-21-cold	Cooldown Sequence	Track a current value and a stored sequence.
18.22 18-22-work / 18-22-transfer / 18-22-cold	Rounds To Clear Queue	Model repeated queue reduction.

Readiness check before you code

1. Classify each activity as fixed traversal or condition-controlled repetition and justify one classification. _____
2. Choose one activity and list the complete state that must still be correct after the loop ends. _____

Notebook and submission procedure

1. Use the sample and transfer cells for formative practice; attempt before opening a reveal.
2. Complete the end-of-notebook cold cells without a reveal or copied solution. Only those cold cells are scored for independent mastery on Lab Days 5–7.
3. Save or download the completed notebook as one `.ipynb` file.
4. Upload that one notebook to the matching Gradescope assignment. Do not export a `.py` file or create a ZIP.
