

Day 4 Mastery Quiz: Comparisons and Boundaries — Instructor Key

Converted value → comparison operator → exact boundary → type-safe threshold note

Instructor key. Same layout as student copy; solutions filled in response boxes. Print duplex on one sheet.

Name		Section		Date	
Score	_____/10		Mastery check		secure / developing / needs support

The pump station has converted its intake fields into numeric flow values. A reading passes the single-value boundary check only when the operator and exact boundary are correct. Do not combine conditions yet; show the comparison evidence one line at a time.

1 Reference code for Items 1–10

[predict](#) [trace](#)

```
1 # converted values from the Day 3 intake process
2 target_lpm = 21.0
3 tolerance_lpm = 0.6
4 low_limit_lpm = target_lpm - tolerance_lpm
5 high_limit_lpm = target_lpm + tolerance_lpm
6 reading_low_edge = 20.4
7 reading_mid = 21.0
8 reading_high_edge = 21.6
9 reading_over = 21.61
10 reading_text = "21.6"
11
12 # individual comparison checks
13 reading_low_edge >= low_limit_lpm
14 reading_low_edge > low_limit_lpm
15 reading_high_edge <= high_limit_lpm
16 reading_high_edge < high_limit_lpm
17 reading_over <= high_limit_lpm
18 reading_mid == target_lpm
```

2 Items 1–5: exact-boundary predictions

[predict](#) [explain](#)

Pt.	Prompt	My response
1	What values are stored in <code>low_limit_lpm</code> and <code>high_limit_lpm</code> ?	Key: <code>low_limit_lpm = 20.4</code> and <code>high_limit_lpm = 21.6</code> .
1	What is the result of <code>reading_low_edge >= low_limit_lpm</code> , and why?	Key: <code>True</code> ; exact lower boundary is included by <code>>=</code> .
1	What is the result of <code>reading_low_edge > low_limit_lpm</code> , and why?	Key: <code>False</code> ; equal is not greater than.
1	What is the result of <code>reading_high_edge <= high_limit_lpm</code> , and why?	Key: <code>True</code> ; exact upper boundary is included by <code><=</code> .
1	What is the result of <code>reading_high_edge < high_limit_lpm</code> , and why?	Key: <code>False</code> ; equal is not less than.

3 Items 6–8: mismatch and type-transfer checks

debug test

Pt.	Prompt	My response
1	What is the result of <code>reading_over <= high_limit_lpm</code> , and which side of the boundary controls the result?	Key: False; 21.61 is above the upper boundary 21.6.
1	What is the result of <code>reading_mid == target_lpm</code> ? Explain why <code>==</code> is not assignment.	Key: True; <code>==</code> compares equality and does not store a value.
1	Why is <code>reading_text <= high_limit_lpm</code> not a safe boundary check in Python?	Key: <code>reading_text</code> is a string and <code>high_limit_lpm</code> is a float; cast before comparing.

4 Item 9: debug a boundary note

debug explain

Boundary note to check

The 20.4 reading fails because it is not greater than the lower limit, and the 21.6 reading fails because it is not less than the upper limit.

Pt.	Prompt	My response
1	Rewrite the note using inclusive boundary language for both exact-limit readings.	Key: The 20.4 lower-edge reading passes with <code>>=</code> and the 21.6 upper-edge reading passes with <code><=</code> ; exact limits are included.

5 Item 10: prepare, but do not combine, the Day 5 evidence

implement transfer

Pt.	Prompt	My response
1	Write the two separate comparison expressions that should be checked for <code>reading_high_edge</code> . Do not connect them with <code>and</code> .	Key: <code>reading_high_edge >= low_limit_lpm</code> and <code>reading_high_edge <= high_limit_lpm</code> .

Support route, not scored

My issue is mostly: setup / Python syntax / type conversion / equality vs assignment / inclusive boundary / exclusive boundary / confidence / time.
My next small action is: test just-below, exact, just-above / rewrite the operator / check type before comparison / ask a partner / ask instructor.
